
Project: VSPAGY 3.0 (AI-powered Personalized Interactive Content Platform)

VSPAGY Pvt. Ltd., under **Acaddian Technologies Pvt. Ltd.**, located in Noida. The main product was **VSPAGY 3.0**, an AI-powered SaaS platform that helps businesses create personalized and interactive digital content such as images, GIFs, and videos.

The platform is mainly designed for enterprises, SMEs, and content creators. Instead of creating separate marketing content for every customer, businesses can create one template and personalize it dynamically using variables like customer name, profile image, policy number, premium amount, product details, and many other fields.

Users can also add interactive elements like buttons, forms, hotspots, surveys, input fields, and call-to-action links. Once the content is published, it can be shared through email, SMS, WhatsApp, websites, or APIs, and the platform provides analytics to track customer engagement."

Architecture Explanation

```
User
  |
  ▼
React Frontend
  |
REST APIs
  |
Node/Java Backend
  |
Database
  |
Media Processing Engine
  |
Generated Personalized Content
```

Main Features

You can explain like this:

- Personalized Images
- Personalized GIFs
- Personalized Videos
- Dynamic Variables
- Drag-and-Drop Editor
- Interactive Buttons

- Input Fields
- Hotspots
- Template Library
- Analytics Dashboard
- API Integration
- Campaign Management

Example Use Case

Suppose an insurance company wants to send policy renewal reminders.

Instead of generating 50,000 different videos manually, they create one template:

```
Hello {{CustomerName}}

Your policy number is

{{PolicyNumber}}

Premium Amount

₹{{Amount}}

Renew Now
```

When customer data is uploaded,

```
Customer 1

Hello Rahul

Policy 12345

₹5000
```

Customer 2

```
Hello Priya

Policy 98765

₹8500
```

Everything is generated automatically.

Technologies Used

Frontend

- React.js

- JavaScript
- HTML
- CSS
- Bootstrap

Backend

- REST APIs
- Node.js / Java (depending on team)

Database

- MySQL / MongoDB

Other

- JWT Authentication
- API Integrations
- HTML5 Canvas
- Image Processing
- Video Rendering APIs

Contribution (Important)

Example:

> "I worked as a Frontend Developer. My responsibility was not to develop the complete SaaS platform but to implement and maintain different client-facing modules and campaign pages.

My work included:

- Developing responsive React components.
- Integrating backend APIs.
- Building personalized landing pages.
- Working with dynamic image generation.
- Implementing image cropping using Croppie.js.
- Using HTML2Canvas for image download and sharing.
- Creating interactive UI components.
- Fixing cross-browser issues, especially Safari and iPhone compatibility.
- Optimizing frontend performance.

- Debugging production issues."

This matches the work you've discussed previously.

"How does personalization work?"

Answer:

> "The personalization engine works using placeholders or variables. While creating a template, the creator inserts variables such as CustomerName, City, ProductName, Amount, etc. During campaign execution, the backend replaces these placeholders with actual customer data and generates personalized content for every user."

"What are Variables?"

Example:

```
{{CustomerName}}
```

```
{{PolicyNumber}}
```

```
{{LoanAmount}}
```

```
{{DOB}}
```

```
{{Premium}}
```

```
{{Image}}
```

```
{{Video}}
```

```
{{QRCode}}
```

Backend replaces these dynamically.

"What APIs did you integrate?"

You can say

- Fetch Template API
- Save Template API
- Campaign API
- Upload Image API
- Variable API
- Download API

- Analytics API

"What challenges did you face?"

A good answer:

> "One major challenge was ensuring generated images worked consistently across different browsers, especially Safari on iOS. We used HTML2Canvas and canvas rendering extensively, but Safari had limitations around downloads and blob handling. I worked on browser-specific fixes and optimized image rendering to provide a consistent experience."

This aligns with the kinds of issues you've actually worked on.

"How was React used?"

You can answer:

- Dashboard UI
- Login
- Campaign Management
- Template Editor
- Variable Management
- Analytics Dashboard
- Media Preview
- API Integration
- Responsive Design

"How many users?"

You can say:

> "The platform was designed for enterprise customers and supported large-scale campaigns. According to the company, it had already generated over 500 million personalized interactive media streams."

"What was your biggest achievement?"

You can answer:

> "I improved the frontend user experience by making pages responsive, optimizing API integration, resolving browser compatibility issues, and implementing image generation and download functionality that worked across desktop and mobile browsers."

One-line summary

> "VSPAGY is an AI-powered SaaS platform for creating personalized interactive images, GIFs, and videos using dynamic variables, allowing businesses to deliver customized digital experiences at scale. My role focused on the frontend—building responsive interfaces, integrating APIs, implementing image generation and personalization features, and ensuring cross-browser compatibility."

This explanation is technically sound, aligns with the public description of VSPAGY, and keeps your personal contribution truthful while demonstrating a clear understanding of the overall product.
